Introduction

The accompanying tables have been prepared to assist Air Force personnel in estimating costs of preparing unit packages of limited size in accordance with requirements of Specification MIL-P-116C. The tables are presented in three sets.

The first set, "Surface Area Tables," (under separate cover) consists of 69 tables used to determine the size category of the item(s) from the overall length, width, and depth dimensions. Instructions for the use of these tables are located in the front section of these tables.

The packaging surface area tables are based on rectangular packages but can be converted for cylindrical packages by applying a factor of 0.75 to surface area values for rectangular-shaped items in the tables.

The second set of tables, bound under this cover, consists of tables numbers I through VI which give labor and material cost data that were used as a basis for the data contained in the third set of tables.

The third set of tables, numbers VII, VIII, IX, X, and XI gives estimated packaging costs derived by adding the direct labor cost to the material cost for each MIL-P-116C method or submethod variation and size category. Separate charts, consisting of tables VII, VIII, IX, X, and XI are provided for each of 15 wage rates ranging from \$1.30 through \$2.70 per hour in 10-cent increments.

The size categories shown in the various tables are based on "package surface area" determined from the overall length, overall width, and overall height or depth of the item or items concerned. Cost data are provided for 20 size categories, up to a maximum of 1,000 square inches, covering all of the MIL-P-116C methods and submethods and their acceptable variations. Packaging costs in instances where the packaging does not conform to MIL-P-116C can usually be computed from the data presented in tables I, II, and VI.

Following is a brief description of tables I through XI:

- Table I. Labor Required to Accomplish Each Task for 100 Like Items. This table lists the direct labor required to do each task in each size category. A task is a simple manual operation that may be common to more than one method or submethod.
- Table II. Material Quantities and Costs Per Task Per 100 Like Items. This table shows the kind, quantity, and costs of the various materials used in accomplishing each task for 100 like items in each size category.

- Table III. Tasks Required to Accomplish the MIL-P-116C Methods and Their Variations. This table lists the tasks, indicated by number, required to package an item by the various methods, sub-methods, and their variations.
- Table IV. Quantity Purchase Discounts. This table lists the percent of discount that can be expected when packaging like items in quantities between 100 and 499 and in quantities of 500 and over. (For quantities of less than 100, the costs as shown in the packaging cost tables apply.)
- Table V. Quantity Purchase Discounts for Fiberboard Boxes. This table lists the percent of discount that can be expected when packaging like items in similar boxes in quantities between 100 and 499 and in quantities of 500 and over.
- Table VI. Labor Costs for Various Time Intervals and Labor Rates. This table shows the labor costs for various increments of time at rates from \$1.30 to \$2.70 per hour in increments of 10 cents. This table is used in determining the direct labor costs for those packs not commonly used and therefore not shown on the packaging cost charts. It is also used to determine the direct labor costs when the amount of labor is known.
- Table VII. Direct Labor and Material Packaging Costs by Surface Area Categories. This table indicates the sum of the direct labor and material costs required to manually unit package items in various size categories according to the various methods and submethods of MIL-P-116C.
- Table VIII. Cost of Paperboard and Fiberboard Containers. This table indicates the fiberboard container costs for the various kinds of fiberboard. Also, this table indicates the labor required to set up the container from the blank. It also includes the time required for loading the box. Closing and taping the box must not be included here as they are separate tasks that were included in the packaging cost tables.
- Table IX. Multiple QUP Assembly. This table indicates the time for counting and assembling the individual items to make up multiple quantity packs and the packaging surface area of the assembled group.
- Table X. Cost of AN Cans (Army-Navy Cans). If the contractor furnishes these AN cans, the appropriate can cost as shown in table X will be included in the total direct packaging cost. In instances where the Air Force furnishes these cans without charge to the contractor, the can cost should not be included in the packaging costs. The cost of loading and sealing the cans has been included under the method variations.

Table XI. Direct Labor and Material Costs of Individual Item Wraps Used in Multiple Quantity Unit Packs. Occasionally items are wrapped individually and placed in a multiple quantity unit pack. This table indicates the cost of wrapping the items individually.

Values shown in the packaging cost tables cover direct labor and materials only, exclusive of all overhead charges. Decisions as to what constitutes a fair overhead and profit charge will be determined by the appropriate Air Force activity.

It is estimated that the average packaging labor wage rate in the United States is about \$2 per hour. However, local wage rates should be used to compute packaging costs. If the local wage rate is not known, it may be obtained from local union, contractor, or employment agency sources. When the proper wage rate has been determined, the chart (tables VII, VIII, IX, X, and XI) corresponding to that wage rate should be used for making packaging cost determinations applicable to a particular area.

Packaging material prices used in computing the specific material costs in the packaging cost tables were those that a small contractor might expect to pay when buying in small quantities. The prices used in computing the various packaging costs are listed in the material price section.

Any time the consumer price index, as provided by the Bureau of Labor Statistics, Washington, D. C., changes noticeably from the July 1958 value (123.9 percent of the 1947-49 average), an adjustment of the total packaging costs should be made. The following formula may be used for this adjustment:

$$\frac{\text{New cost of living index}}{123.9 \text{ (July cost of living index)}} \times \text{packaging cost of July 1958*} = \text{new packaging cost}$$

(\*The proper labor rate packaging cost chart current during July 1958 should be used for determining the packaging costs. Changes in the cost of living index will reflect any change in labor rate as well as changes in material costs.)

#### How To Estimate Packaging Costs

1. Determine the size category of the item(s) by measuring the overall length, width, and depth and referring to the "Packaging Surface Area Tables." (See instructions for these tables located in front of the tables.)

2. If the wage rate to be used falls between two rates for which charts (tables VII, VIII, IX, X, and XI) are provided, subtract the packaging cost value shown on the chart based on the lower wage rate from that shown on the chart for the upper wage rate. A proportionate amount of this difference (one-tenth of the difference for each cent that the rate to be used exceeds the rate for the lower chart) shall be added to the value shown on the lower chart.

3. Determine the required QUP<sup>1</sup> of the pack by referring to the packaging code as explained in AMC Manual 71-2 and proceed as follows:

A. If the unit pack is composed of more than one item and the items are not in a loose pack:

(1) Locate the QUP in the left hand column of table IX, "Multiple QUP Assembly."

(2) The labor costs for counting and arranging the items will be found in the appropriate item surface area size column labeled "cost of labor." This labor cost must be added to the total packaging labor costs.

(3) The "packaging surface area" (P.S.A.) of this assembled group will be found adjacent to the appropriate labor figure determined under (2). This packaging surface area value for the assembled group will be used in conjunction with the packaging cost tables to obtain the combined packaging cost applicable to the group of items.

(4) In some instances a multiple pack is designed where each individual item is wrapped before assembling. In this instance refer to tables I, II, and VI in this book and compute the labor and material costs of the appropriate wrapping tasks, or determine the wrapping cost by referring to table XI. Add this cost to the total packaging costs.

B. If the unit pack is composed of more than one item and these items are loosely packed by being dropped into a sack or box, the labor required is 0.0095 minute per item regardless of the item size (within the limits of these tables). This labor time multiplied by the QUP and the product multiplied by the applicable wage rate should be included in the total packaging cost for such loose packed items.

C. If the unit pack is composed of one item, the packaging surface area for one item will be used in determining the total packaging costs. There is no extra labor involved in this instance.

---

<sup>1</sup>QUP = quantity per unit pack.

4. Locate in the left hand column of the packaging cost tables (table VII), the method, submethod, and variation conforming to the one used for the item.

5. When QUP is one item, the total packaging cost will be found opposite the appropriate method variation and under the proper size range unless an asterisk (\*), double asterisk (\*\*), or degree (°) appears with the total cost. One asterisk indicates that the cost of a fiberboard container and labor of assembling and loading it must be added to the total packaging cost given. (See table VIII.) The kind of fiberboard container to select depends upon the use, weight, and total dimensions of the item(s). The fiberboard container cost table has been extended to 14,000 square inches to provide packaging costs of intermediate containers in the larger sizes.

The cost of the appropriate size and kind of fiberboard container can be determined by reference to the fiberboard section of these tables. In instances where two asterisks appear in the tables, the cost of two appropriate fiberboard containers must be added.

A degree sign (°) appearing with the total cost figure indicates an AN can is used as a container. The cost of this container, if furnished by the contractor, must be added to the total packaging costs given.

Determining the Packaging Costs of Items Not Packaged  
in Accordance with Specification MIL-P-116C

Occasionally it is desirable to determine the packaging cost of an item that is packaged by materials or methods not in accordance with MIL-P-116C. In some instances if the required tasks are included, it is possible to compute the packaging costs of items so packed by referring to tables I, II, and VI and adding the proper costs together for the appropriate size.

Discounts for Packaging Items in Large Numbers

Table IV (in this book) shows the discount that can be expected for the various methods when packaging 100 or more like items on the same contract. Also, table V indicates the discount expected when 100 or more like fiberboard boxes are involved in the same contract.

<sup>1</sup>Class B and D materials are for the most part on the market as type I only. This, we believe, is due to relatively small requirements for the lighter type materials. Type I naturally meets the requirements of types II and III.
